NIGHT DESK GUIDE

Alex Hale's Board · everything added in October 2026 · plain-language instructions

Where things are. The **Night desk** tab (after Signals) holds most of the new parts, one section each, with a row of jump links at the top. Two more new tabs follow it: **MACRO** and **Ask Claude**. The pop-out price chart has new **LEVELS** and **TRADE** buttons. The phone page has new cards. Every part also has a short entry in the board's **? Legend**.

Phone pushes. All alerts arrive through the ntfy app, like your other board alerts. Each kind has its own switch on the Night desk; the noisy ones start switched off. Nothing here places a trade by itself: the only things that send orders are the order ticket's red **Send** button and the SELL ALL button you already have.

Contents

1. Session alerts and the overnight venue
2. Halts, before-bed card, combos, odds
3. Leveraged ETF twins and market data
4. ETF pick of the hour
5. Big money and politicians
6. Web watch
7. Earnings and trading tools
8. Order ticket
9. Levels and trading on the chart
10. MACRO tab
11. Ask Claude page
12. IB Gateway auto-login
13. System check
14. Phone page cards
15. Settings you can change
16. If something looks wrong

1. Session alerts and the overnight venue

Part	What it does
Overnight high / low broken	After 9:30 am, a push when a stock crosses above its overnight (8 pm - 4 am) high or below its overnight low. Once per stock per side per day.
Pre-market high / low broken	After 9:30 am, a push when a stock crosses its 4:00 - 9:30 am high or low: the classic "gap and go" trigger.
Overnight venue looks down	Overnight, a push if every stock on IBKR's overnight venue stops updating for 15+ minutes at once while futures keep moving (the venue itself stopped), and another when prices come back.
Spreads	The gap between bid and ask on your IBKR board symbols overnight. Wide spreads cost you on every fill; board chips SPREAD, AH PEAK and NO TRADES flag it.
Busy overnight hours	Overnight volume peaks around 9 pm and 3 am New York time (Asia opening and closing). The table also counts your own fills by hour.

Dec 6, 2026 session	Nasdaq and NYSE start trading 9 pm - 4 am themselves (pause 8 - 9 pm, limit orders only, 20% price bands). Trades 9 pm - midnight carry the next day's date; your journal counts them that way.
Block trades	The IBKR price feed now also reports single trades of $1 million or 20,000 shares or more (see Big money).

2. Halts, before-bed card, combos, odds

Part	What it does
Trading halts	A push when a stock on your boards or that you hold is halted or resumes, with the reason in plain words (news pending, volatility pause, SEC...). Source: Nasdaq's free halts feed. A second switch covers every US stock (noisy).
Before-bed card	Each evening before a trading day (7:45 pm unless you change `JB_BEDTIME`): what you hold, earnings tonight or before the open, big data before 10:30 am, Fed events, holidays. HEADS-UP = something touches what you hold.
Tap to open	Tapping a phone alert opens that stock's chart on the IBKR board (or the Night desk).
Combo alerts	Two conditions that must both be true, for example NVDA above its overnight high AND ES=F up 0.5%. Once per session.
Data reactions	How S&P, Nasdaq and Dow futures moved 1 and 5 minutes after a big US number, next to actual vs expected.
Fed, CPI and jobs odds	What Kalshi's public prediction markets price for the next Fed decision, CPI and jobs numbers. Read only, free.
Mac heartbeat	The Mac pings healthchecks.io every 5 minutes; if it stops (power cut, Mac asleep), healthchecks.io pushes your phone. Needs a free healthchecks.io account and `JB_HEARTBEAT_URL` in settings.env.

3. Leveraged ETF twins and market data

Part	What it does
Leveraged ETF twins	Each 3x (or 2x) bull fund next to its inverse twin and the index behind it, with the move since the 4 pm close: TQQQ / SQQQ, SPXL / SPXS, SOXL / SOXS, TNA / TZA, and more. Buttons 3x / 2x / All. An **off** chip means a fund is not moving about 3x the index right now (fees, the daily reset, or a stale price). Add or remove pairs right there.
Prices overnight	Your boards' live prices come first (overnight too, on the IBKR board). Otherwise Yahoo every 2 minutes, which has nothing 8 pm - 4 am. For overnight numbers, keep the funds you trade on your IBKR board.

Gapper checklist	For each stock gapping 2%+ before the open: gap 2-10%, a reason, pre-market volume 5x its usual, price $5-100, holding the top half of its range. Score out of 5.
Short interest and float	Short % of float, days to cover, change vs the last report (published twice a month; checked every 3 hours, push when new) and FINRA's daily short-volume share vs its average.
Unusual options	Option contracts trading at least 500 and twice their open interest today: someone making a big new bet. Push once per stock per day.
Analyst ratings	Upgrades, downgrades and new coverage for your stocks, with a push.
Scanner columns and chips	A "Float / Rel vol" column on the scanner and tags saying why a stock is moving (EARNINGS, ANALYST, 8-K, SECTOR, NO NEWS...). Nothing was removed from the scanner.

4. ETF pick of the hour

Every hour on the hour, Sunday 8 pm to Friday 8 pm New York time, the board picks one 3x fund from the twins list by fixed rules. It is free: these are rules written into the board, not AI, and not advice.

Rule	Points
Index move since the 4 pm close	Up to 40. A bigger move in the fund's direction scores more (the bear fund scores when the index falls).
Last hour going the same way	Up to 30. The move is still building rather than fading.
Market mood agrees	Up to 20. The World tab's mood: risk-on for bull funds, risk-off for bear funds (stock indexes only).
Heavy volume in the fund	Up to 10, from relative volume.
Under 35	Nothing is clear: "no clear pick, stay flat."

One hour later each pick is graded by how much the fund moved, and the **track record** shows how often the rules were right. **Ask Claude about this** opens the Claude app with the pick and its reasons filled in for a second opinion. A push per pick is optional (off to start). The rules know nothing about news, and 3x funds can turn fast.

5. Big money and politicians

Part	What it does
Who owns it	For each stock on your boards or that you hold: % owned by institutions and by insiders, the biggest institutions and funds, and whether each added or cut in its latest quarterly 13F report. 13F reports can be 45+ days old when they come out. 3x ETFs usually show nothing here.

Insider trades	Officers and directors buying or selling their own company's stock in the last 90 days (SEC Form 4, filed within 2 business days). Buys with their own money are the ones traders watch.
Block trades	Single trades of $1 million or 20,000+ shares as they print on your IBKR board, in any session. Change the sizes with `JB_BLOCK_DOLLARS` / `JB_BLOCK_SHARES`.
Dark pools	Shares traded off-exchange per week (FINRA's free data, 2-4 weeks late). A week far above the others can mean a fund quietly building or selling.
Politicians	Stock trades reported by members of Congress from the official House Clerk and Senate filings, checked every 6 hours. "Your stocks" first, "All recent" for everything. They have up to 45 days to report, so treat it as background. Amounts are ranges because that is how they are filed.

6. Web watch

A free crawler for your board stocks and holdings that fills the gaps between the news feeds. Each kind has a push switch, all off to start. The sources table shows when each was last checked and any problem.

Source	How often and why
Press releases	Every 2 minutes from GlobeNewswire, PR Newswire and Business Wire. Companies publish here first, often minutes before news sites.
Reddit	Every 3 minutes (wallstreetbets, stocks, options, StockMarket). A spike = a ticker mentioned far more this hour than usual. Crowd attention, not facts.
SEC filings	Every 5 minutes: your companies' filings beyond the Signals tab's 8-K / insider / 13D (offerings such as S-3 and 424B, 5% holders, late reports), plus other companies' 8-Ks that mention yours (deals, partners).
Wikipedia and Google Trends	Wikipedia views every 15 minutes (a day 3x the usual is a spike); the US trending-searches list every 30 minutes (unofficial, best effort).
Unexplained moves	A stock of yours moving 3%+ since the 4 pm close with nothing found anywhere. Someone may know something the news hasn't caught; be extra careful.

7. Earnings and trading tools

Part	What it does
Game plan	A note you write the evening before, pushed to your phone at 9:00 am New York time on trading days (`JB_PLAN_TIME`). Editable on the phone page too.
Expected move	For stocks reporting in the next 8 days: the move the options market is pricing in, next to the stock's usual move on past reports.

Call clock	When results and the earnings call come out, with a countdown and a push 10 minutes before the call.
Limit price helper	Bid, ask and a fair limit price for a buy or sell, the cost for your shares, and the exchanges' 20% overnight price band.
Stress test	What your holdings would gain or lose if the S&P 500 fell 1%, 3% or 5%, or moved like the futures since 4 pm.
Night vs day	A year of holding a symbol only overnight vs only during the day, as two lines.
Fill quality	Each of your fills vs the middle of the bid and ask at that minute: did you pay up?

8. Order ticket

Buy or sell a stock or ETF on **IBKR or Webull** from the Night desk, the phone page, or under the chart. Limit orders only, good for today, in any session (overnight goes to IBKR's OVERNIGHT venue or Webull's night session).

Step	What happens
1. Fill it in	Broker, symbol, buy or sell, shares, limit price. Tap bid, ask or last to use that price.
2. Check order	Asks the broker for your account (it says **REAL MONEY** or paper), what you hold and the route. Sends nothing.
3. Send	The red Send button sends exactly the checked order (good for 2 minutes). Every order sent also comes as a phone push.
Safety limits	Refused: a limit more than 5% from the last price (typos), more than `JB_TICKET_MAX` dollars per order (5000 to start), selling more than you hold, part shares.
Recent tickets	Your last orders and their status, with a Cancel button while one is open.

9. Levels and trading on the chart

Button	What it does
LEVELS	Under the pop-out chart. Tap LEVELS, then tap the chart at a price to drop a yellow line there, or type a price. Levels are saved on the Mac, so they stay on that symbol's chart, on the board and the phone, until you remove them.
Level alerts	Tap "alert off" next to a level to arm it: you get one push when the price crosses it, then it switches itself off. Arm it again to repeat.
TRADE	Opens the order ticket for that symbol under the chart. Tap the chart to set the limit at that spot, or use the -2% … +2% and "now" buttons around the current price; "all I hold" fills in your whole position to sell. Same Check / Send steps and limits.

Lines on the chart	Yellow = your levels (bell = alert on); pink = what you paid; green / red = your open buy / sell orders and the limit you are setting.

10. MACRO tab

The slow-moving economic backdrop from free official data (FRED, the St. Louis Fed): interest rates, inflation, jobs, growth and market stress, plus the S&P 500 vs its 200-day average. It changes over weeks and months: a tailwind or headwind for your 3x funds, not a signal for tonight.

Part	Reading it
Big number	Each indicator scores -1 (hurts stocks) to +1 (helps) by fixed rules; the big number is their average × 100. **Tailwind** = +20 or more, **Headwind** = -20 or less, otherwise Mixed. Bars show each group (Rates, Inflation, Jobs, Growth, Markets).
Indicator cards	Latest value, HELPS / HURTS / NEUTRAL, a line chart of recent months, and one sentence on why. Daily ones update each evening; monthly ones when the government publishes them.
Score over time	The big number saved once a day, as a line.
Macro news	The last 7 days of Fed, inflation, jobs, growth, rates and tariff headlines, every 30 minutes, with a simple upbeat / worried word count.

11. Ask Claude page

Type a question. **Copy and open Claude** copies it together with the board's live numbers you tick, and opens the Claude app (or claude.ai) with it filled in. It is free: no API key. The board sends nothing anywhere; your question goes to Claude only when you press send in the Claude app, and it counts toward your normal Claude plan.

Part	What it does
Board data	Tick what Claude should see: market now, your board symbols, 3x pairs, your positions, the ETF pick, earnings, halts and odds, MACRO, big money, web watch, headlines. "show what is sent" shows the exact text.
Too long for the link	The app opens with your question; paste the rest (already on your clipboard) as your next message.
Quick questions	Ready-made questions to tap. Your last 12 questions are kept on that phone or computer.

12. IB Gateway auto-login

IBC (free, open source) starts IB Gateway on the Mac and types your IBKR username and password. You only tap **Approve** in the IBKR Mobile app (IB Key) when IBKR asks: about once a week, and

whenever IB Gateway starts from scratch (a Mac restart). IB Gateway restarts itself every night at 11:50 pm New York time, during IBKR's own nightly reset, so you lose about a minute of prices.

Task	How
Set it up	On the Mac: `cd ~/josephs-board && ./jb ibkr-autologin`. It finds IB Gateway, downloads IBC, asks your IBKR username and password once (the password doesn't show as you type), and starts it. Then tap Approve on your phone.
Your password	Saved only in `ibc/config.ini` inside the board folder, readable only by your Mac account. Never printed, never sent anywhere but IBKR's login.
Phone push	When IBKR is waiting for your Approve tap, the board pushes you (at most every 20 minutes while it waits), and once more when it has logged in.
Restarts	`./jb restart` leaves a running IB Gateway alone. `./jb restart ibgateway` restarts it (then tap Approve).
Stop it	`./jb ibkr-autologin off`, then log in to IB Gateway by hand as before.
Needs	The stand-alone (offline) IB Gateway 10.x installed in Applications. The Night desk's "IB Gateway auto-login" section and the Health tab show its state.

13. System check (is everything live?)

A box at the top of the **Phone page** and the **Health** tab shows **ALL LIVE** (green), **a few things to check** (amber) or **SOMETHING IS DOWN** (red).

Task	How
Check everything now	Tap **Run check**. In about 10-20 seconds it tests every part of the board, both brokers and IB Gateway, your phone alerts and each free website the board reads, then pushes the answer to your phone: "Board check: ALL LIVE", or what is down and how to fix it.
See the details	Tap **Details** (or the **System check** link on the phone page) for the full list, grouped, with a fix next to anything amber or red.
Test phone alerts	**Send test push** on the details page.
Get told when something breaks	Switch on **Push me when something breaks** (off to start): it looks every 5 minutes and pushes when a part stays down 10+ minutes, and again when it is fixed.
Amber is often fine	A broker that is closed right now, or a website that briefly rate-limited the board, shows amber. Red is what needs you.

14. Phone page cards

The phone page (`/phone.html`) gains: the **order ticket**, your **game plan** (read or edit), and links to **Macro**, **Ask Claude** and **System check**, and the System check box at the top. The Night desk itself is

laid out for the phone too.

15. Settings you can change (settings.env)

Setting	What it changes
JB_TICKET_MAX	The most one order ticket order may cost, in dollars (5000 to start).
JB_BEDTIME	When the before-bed card is pushed (default 19:45).
JB_PLAN_TIME	When your game plan is pushed (default 9:00).
JB_BLOCK_DOLLARS / JB_BLOCK_SHARES	The size of a "block trade" (default $1,000,000 / 20,000 shares).
JB_HEARTBEAT_URL	Your free healthchecks.io ping address, for the Mac heartbeat.
RUN_IB_AUTOLOGIN	on / off for the IB Gateway auto-login (set by `./jb ibkr-autologin`).

After changing settings.env: `cd ~/josephs-board && ./jb restart`.

16. If something looks wrong

You see	Do this
A section is missing	Refresh with Option+Command+R. Each section appears only once its update is installed.
Red error text under a section	That free source failed this time (busy site, rate limit). It retries by itself; if it stays red for a day, send Claude the last few lines.
Twins show no price overnight	Yahoo has no prices 8 pm - 4 am; add the fund to your IBKR board for live overnight prices.
Politicians: "pypdf is missing"	`cd ~/josephs-board && .venv/bin/python -m pip install pypdf`, then `./jb restart gateway`.
IB Gateway keeps asking to approve	Open IBKR Mobile and tap Approve. If it says the login failed, run `./jb ibkr-autologin` again to retype it.
Text spills out of tiles	The page is zoomed: Command+0.

Alex Hale's Board · Night desk guide · October 2026. Free data sources: IBKR and Webull (your accounts), Yahoo Finance, FINRA, SEC EDGAR, FRED (St. Louis Fed), Nasdaq Trader, Kalshi, House Clerk and Senate eFD, GlobeNewswire, PR Newswire, Business Wire, Reddit, Wikipedia, Google News and Trends. Nothing here is financial advice.

NIGHT DESK GUIDE · PART 2

Alex Hale's Board · the final ideas (October 7, 2026) · plain-language instructions

> **Where things are.** Most new parts are new sections at the bottom of the **Night desk**. The price boards get a second small chip row and options lines on the QQQ / SPY charts; the World tab gets Fed odds, breadth and the Bitcoin book; My trading gets the scorecard; Health gets internet drops; the ticket gets a **More** section. Nothing else on the page moved. Every part has a short entry in the board's **? Legend**.

17. Safety stops, targets and trailing stops

Part	What it does
Safety stop	For shares you hold. The board checks the price every few seconds in every session, overnight too, and on Webull (which has no overnight stop orders of its own). Two readings in a row past your level are needed, so one odd trade can't set it off. Then it sells with a limit a little under the price (0.5%, then 1%, 2%, 3%, 20 s each) and pushes you the result.
Target	Sells when the price reaches it. With a stop as well, whichever comes first sells (a bracket). The board watches it; it is not placed at IBKR as a real bracket order, so the Mac must be on.
Trailing stop	The stop follows the price up by the % you choose and never moves down. Works overnight.
Break-even	After the price is up the % you pick, the stop moves up to what you paid.
Where	Night desk: **Safety stops and targets**. Or on a buy: the ticket's **More** section. The stop starts once the buy fills.

18. Order ticket extras

Part	What it does
Good for	**This session** (as before), **overnight + tomorrow** (IBKR only: keeps working from the overnight session into the next day) or **until I cancel**.

Ladder	Split one order into 2-5 limits a few cents apart, to get better average fills on thin overnight prices.
Size buttons	$500 / $1,000 / $2,500 (change them on the Night desk) fill in the number of shares for that many dollars.
IBKR preview	Check order also shows IBKR's own estimate: cost, commission and margin after the order. A warning appears if you sent the same order in the last few minutes.
Flip	Sells a 3x fund and buys its twin (TQQQ to SQQQ, SOXL to SOXS...) for the same dollars. It shows the plan first and you confirm with a short code.
Chase	On an open order in the list: moves the limit toward the price up to 6 times (never more than 1% away from where you started) so it fills.

19. Scheduled orders and sell at the open

Part	What it does
What it does	Sends an order at the 9:30 open, 4 am pre-market, 4 pm after-hours, 8 pm overnight, or a date and time you pick (New York time). Holidays and early closes are skipped.
Conditions	Optional, up to two: e.g. only if NQ=F is up at least 0.3% vs the 4 pm close and TQQQ is up at least 0% (held its gain). Checked at that moment; if one fails, the order is skipped and you get a push saying why.
Paper first	Unticked "Real order" = paper: it only records what it would have done. Watch a few before trusting one with money.
Sell at the open	Sell, "all", at the 9:30 open, real. Without a limit it sells like a safety stop so it fills.

20. Fills, notes, scorecard and the weekly report

Part	What it does
Fill push	A push for every fill (ticket, chart, algo, SELL ALL): what, how many, the price, and how far that was from your limit or the last price. IBKR within about 30 s, Webull within about 3 min.

Automatic notes	Each fill gets a note: the session, the move since the close, QQQ, SPY, VIX and what sent it (ticket, stop, flip, schedule, algo).
Scorecard	My trading tab and Night desk: profit factor (dollars won divided by dollars lost; above 1.5 is good), expectancy (what an average trade makes), average win vs loss, longest losing streak, by weekday and by ETF.
Weekly report	Every Friday 8:30 pm New York: a PDF of the week with a push linking to it. "Make this week's report now" on the Night desk.
Go-live checklist	Night desk: what should be true before an algo trades real money (paper days, win rate, profit, worst day, SELL ALL tested, loss limit on with algo pause, algo checking in). **./jb live** runs it first and asks you to type LIVE.

21. 3x ETF edge

Part	What it does
Trend light	The dot on 3x / 2x tiles: green, grey or red from the matching futures' trend (NQ for Nasdaq funds, ES for S&P funds). Futures trade almost 24 hours, so it keeps working overnight.
FAIR chip	How far a 3x fund trades above (+) or below (-) what its futures or index say it should since 4 pm. Thin overnight trading often lags the futures.
Rebalance and decay	The fund's estimated end-of-day buying or selling in dollars, and how much it lost to daily resetting over 5 and 20 days.
Drift and calendar	How each fund has moved by session and weekday; options expiry, triple witching, VIX expiry and index rebalance days.
Options levels	QQQ and SPY charts: dotted lines where big options positions sit. Magnet = prices the market tends to stick to; fast = moves can speed up; gamma flip = below it moves tend to be bigger.
Macro gauges	World tab: VIX curve warning, Fed meeting odds (Kalshi) and Nasdaq-100 breadth. Night desk: net liquidity (FRED), Treasury auction results (push on a weak one), CFTC futures positioning, yen and VIX pushes.
Fund card and history	The ⓘ chip on a tile: what the fund tracks, its fee, size and top holdings. Night desk: a price history table with a CSV download.

22. News, crowd and price feeds

Part	What it does
Top news	One ranked list from every feed, the same story from several sources folded into one. Your holdings first, then your boards.
IBKR newswire	Free Briefing.com and Dow Jones headlines through IB Gateway, with a push for stocks you hold. If it says "not subscribed": Client Portal > Settings > Research Subscriptions, add the free BRFG, BRFUPDN and DJNL.
Reddit and Bluesky	Reddit rank from ApeWisdom (REDDIT # chip, purple when mentions doubled). Bluesky counts are optional: they need a free Bluesky account (JB_BSKY_HANDLE and JB_BSKY_APP_PASSWORD in settings.env).
Polymarket and policy	Busy Polymarket questions about the Fed, rates, tariffs and elections. Policy posts from Truth Social and the White House (best effort: Truth Social sells a fast feed, so the free page can be slow).
Pressure	BUYERS / SELLERS chip: of the shares traded on IBKR in the last 15 minutes, how many traded at the ask vs the bid.
Price cross-check	When IBKR and Webull disagree by 0.75%+ on the same symbol, the tile says PRICES DISAGREE and the algos skip new entries in it.
Bitcoin order book	World tab: Gemini's free order book. Heavy selling on a weekend often comes before a rough Sunday 6 pm futures open. Yahoo gives the price if Gemini does not answer.

23. Mac guardian and algo safety

Part	What it does
Checks	In System check: restart after a power cut, memory, the Mac clock, macOS updates that could restart it overnight, services crashing over and over, algos that stopped checking in, last backup.
Backups	Every night 2:30 am New York, to ~/josephs-board/backups, last 7 kept (optional copy to iCloud Drive). They include settings.env, so keep them private.
Internet drops	Checked every 30 s; drops of 2+ minutes are listed on the Health tab and pushed when the internet is back.

Crash loop	A part that restarts 6 times in 10 minutes is held back for an hour, with one push, instead of restarting over and over.
SELL ALL confirm	After SELL ALL the board checks again after 60 s and sells what is left, up to 3 times. Early loss warnings come at 50% and 75% of your daily limit.
Weekend	Sunday 5 pm: a self-test push before futures open. Saturday 7 am: the board restarts its parts one at a time to clear memory, then runs System check.
Algos	Both algos write a heartbeat (push if one is quiet for 3 minutes) and skip new entries while the prices disagree. Paper and live: safe mode while the broker connection is lost and an order speed limit (3 a minute, 30 a day), so paper behaves like live would. Live also checks the position against the broker every minute.
Urgent pushes	SELL ALL, a stop firing and the loss limit go out at top priority. Allow ntfy in your iPhone Focus once (Settings > Focus > your Focus > Apps) so they get through.

24. Everyday tools

Part	What it does
Command bar	Press / on the Mac or tap the ⌕ next to the board's name (on the Phone page: the search box). Type TQQQ, TQQQ buy, TQQQ sell, TQQQ news, flip SOXL, TQQQ note your words, or a tab name.
Any-symbol chart	Any symbol, futures (NQ=F) or index (^N225) opens in your own board chart, with Yahoo prices when the board doesn't stream it.
Keys (Mac)	1-9 and 0 switch tabs; B / S open buy / sell on the selected symbol; Esc closes pop-ups; ? shows the list.
Symbol notes	A short note per symbol: a NOTE chip on the tile, and shown on the order ticket.
Since you last looked	Coming back after 20+ minutes, a small box lists what happened meanwhile: fills, alerts, stops and schedules, big moves, news on what you hold.
Filled-in chart	After the Mac was off or offline, the board fills the hole from IBKR's history (overnight too). Those stretches are drawn in a dimmer blue-grey.

Widget and Siri	Night desk: "Show my setup steps" gives a home-screen widget for the free Scriptable app and a "Hey Siri, how's the board" shortcut, with your link filled in. Read-only: they can never trade.
Alert manager	Night desk: every alert and switch from every tab on one page, with a test push.

25. One-time setup on your side

Part	What it does
Power cut restart	In Terminal on the Mac: `sudo pmset -a autorestart 1` (asks the Mac password). System check turns green.
IBKR newswire	Client Portal > Settings > Research Subscriptions: add the free BRFG, BRFUPDN and DJNL feeds.
Focus test	Night desk > Alert manager > Send a test push while a Focus is on. If it doesn't show, allow ntfy in that Focus.
Mac went quiet	On healthchecks.io, set your check's ntfy priority to the highest (that push comes from healthchecks.io, not the Mac).
On from the start	A heads-up push before big news (the algos keep trading), and cancelling orders left over from the previous session. Switch either off in Orders.
Off until you switch them on	Pausing the algos for big news, cancelling today-only orders after a set number of minutes, Polymarket pushes, iCloud backup copy, and real (not paper) scheduled orders.
